White (Ladino) Clover
*Trifolium repens*

**Description**
Long-lived perennial cool-season legume spread by stolons. Plants are leafy and are 8 to 12 inches tall. Leaves and stems are non-hairy. Ladino is a taller-growing form of white clover.

**Uses**
Pasture and wildlife.

**Advantages**
Ease of establishment into existing cool-season grasses. High quality and high animal acceptance. Long stand life. Tolerant of wide range of soil and climatic conditions (especially cool and wet). Good seed production under grazing.

**Disadvantages**
Poor summer growth. Low yielding. Not good for hay. Potential for bloat (especially in spring and with thick, lush stands). Thick stands of established white clover can be extremely competitive with interseeded forages.

**Seeding**
Rate: 1-3 lb/a
Depth: ¼-½ in
Primary Date: Feb 1-Apr 15
Secondary Date: Aug 1-Sep 15

**Harvest**
First harvest: Not applicable
Annual yield: 1-3 tons dry matter/a
